PERUZZI 77 and SCHINDLER 81 errors do not include the 0.13% uncertainty in the absolute SPEAR energy calibration. TRILLING 81 uses the high precision $J/\psi(1S)$ and $\psi(2S)$ measurements of ZHOLENTZ 80 to determine this uncertainty and combines the PERUZZI 77 and SCHINDLER 81 results to obtain the value quoted.

D^{\pm} MEAN LIFE

Measurements with an error $>100\times10^{-15}$ s have been omitted from the Listings.

D⁺ DECAY MODES

Most decay modes (other than the semileptonic modes) that involve a neutral K meson are now given as K_S^0 modes, not as \overline{K}^0 modes. Nearly always it is a K_S^0 that is measured, and interference between Cabibbo-allowed and doubly Cabibbo-suppressed modes can invalidate the assumption that $2\Gamma(K_S^0) = \Gamma(\overline{K}^0)$.

| | Mode | Fraction (Γ_i/Γ) | Scale factor/ Confidence level | | | | | | |
|-----------------|------------------------------------|------------------------------|-----------------------------------|--|--|--|--|--|--|

- [a] The branching fraction for this mode may differ from the sum of the submodes that contribute to it, due to interference effects. See the relevant papers.
- [b] These subfractions of the $K^- 2\pi^+$ mode are uncertain: see the Particle Listings.
- [c] See the listings under " $D \rightarrow K \pi \pi \pi$ partial wave analyses" and our 2008 Review (Physics Letters **B667** 1 (2008)) for measurements of submodes of this mode.
- [d] The unseen decay modes of the resonances are included.
- [e] This is not a test for the $\Delta C=1$ weak neutral current, but leads to the $\pi^+ \ell^+ \ell^-$ final state.
- [f] This mode is not a useful test for a $\Delta C=1$ weak neutral current because both quarks must change flavor in this decay.

FIT INFORMATION

An overall fit to 33 branching ratios uses 43 measurements to determine 17 parameters. The overall fit has a $\chi^2=$ 64.4 for 26 degrees of freedom.

The following off-diagonal array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \cdot \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\text{total}}$.

³ The ABLIKIM 05A result together with the $D^0 \rightarrow K^- e^+ \nu_e$ branching fraction of ABLIKIM 04C and Particle Data Group lifetimes gives $\Gamma(D^0 \rightarrow K^- e^+ \nu_e) / \Gamma(D^+ \rightarrow \overline{K}^0 e^+ \nu_e) = 1.08 \pm 0.22 \pm 0.07$; isospin invariance predicts the ratio is 1.0.

⁴ DOBBS 08 establishes $\left|\frac{V_{cd}}{V_{cs}} \cdot \frac{f_{\pm}^{\pi}(0)}{f_{\pm}^{K}(0)}\right| = 0.188 \pm 0.008 \pm 0.002$ from the D^{+} and D^{0} decays to $\overline{K}e^{+}\nu_{e}$ and $\pi e^{+}\nu_{e}$. It also finds $\Gamma(D^{0} \rightarrow K^{-}e^{+}\nu_{e}) / \Gamma(D^{+} \rightarrow \overline{K}^{0}e^{+}\nu_{e}) = 1.06 \pm 0.02 \pm 0.03$; isospin invariance predicts the ratio is 1.0.

 $^1\,{\sf AAIJ}$ 23H parameterise the $\pi^+\,\pi^-$ S-wave using one complex number per bin in 50 bins of $\pi^+\pi^-$ invariant mass. ² The last error reflects the uncertainty on the amplitude model.

 3 LINK 04 borrows a K-matrix parametrization from ANISOVICH 03 of the full π - π Swave isoscalar scattering amplitude to describe the $\pi^+\pi^-$ S-wave component of the $\pi^+\pi^-\pi^-$ state. The fit fraction given above is a sum over five f_0 mesons, the $f_0(980)$, $f_0(1300)$, $f_0(1200-1600)$, $f_0(1500)$, and $f_0(1750)$. See LINK 04 for details and discussion. sion.

D^{\pm} CP-VIOLATING DECAY-RATE ASYMMETRIES

This is the difference between D^+ and D^- partial widths for the decay to state f, divided by the sum of the widths: $A_{CP}(f) = [\Gamma(D^+ \to f) - \Gamma(D^- \to \overline{f})] / [\Gamma(D^+ \to f) + \Gamma(D^- \to \overline{f})].$

 1 This is the integrated CP asymmetry. LEES 13F also searches for CP asymmetries in four regions of the Dalitz plots (two of which are listed below); in comparisons of binned D^+ and D^- Dalitz plots; in parametrized fits to those plots, including 2-body submodes; and in comparisons of Legendre-polynomial distributions for the K^+K^- and $K^-\pi^+$ systems.

²AUBERT 05S measures $N(D^+ \rightarrow K^+ K^- \pi^+)/N(D_s^+ \rightarrow K^+ K^- \pi^+)$, the ratio of the numbers of events observed, and similarly for the D^- .

- ³ FRABETTI 94I, AITALA 98C, and LINK 00B measure $N(D^+ \rightarrow K^- K^+ \pi^+)/N(D^+ \rightarrow K^- K^+ \pi^+)$ $K^{-}\pi^{+}\pi^{+}$), the ratio of numbers of events observed, and similarly for the D^{-} .
- 4 RUBIN 08 performs a dedicated analysis of this decay mode on the same dataset, with slightly better precision. We therefore take it that BONVICINI 14 does not supersede RUBIN 08's A_{CP} result.

$A_{CP}(K^{\pm}K^{*0})$ in $D^+ \rightarrow K^+\overline{K}^{*0}$. $D^- \rightarrow K^-K^{*0}$

$D^{\pm} \chi^2$ TESTS OF *CP*-VIOLATION (*CPV*)

We list model-independent searches for local *CP* violation in phase-space distributions of multi-body decays.

Most of these searches divide phase space (Dalitz plot for 3-body decays, five-dimensional equivalent for 4-body decays) into bins, and perform a χ^2 test comparing normalised yields N_i , \overline{N}_i in *CP*-conjugate bin pairs $i: \chi^2 = \Sigma_i (N_i - \alpha \overline{N}_i) / \sigma (N_i - \alpha \overline{N}_i)$. The factor $\alpha = (\Sigma_i N_i) / (\Sigma_i \overline{N}_i)$ removes the dependence on phase-space-integrated rate asymmetries. The result is used to obtain the probability (p-value) to obtain the measured χ^2 or larger under the assumption of CP conservation [AUBERT 08AO, BEDIAGA 09]. Alternative methods obtain p-values from other test variables based on unbinned analyses [WILLIAMS 11, AAIJ 14C]. Results can be combined using Fisher's method [MOSTELLER 48].

Amplitude analyses

$D \rightarrow K \pi \pi \pi$ partial wave analyses

Amplitude analyses of D^+ decays to a variety of 4-body kaon or pion final states, fitting simultaneously different partial wave components.
