Λ_c^+

$I(J^P) = 0(\frac{1}{2}^+)$ Status: $\ast\ast\ast\ast$

The parity of the Λ_c^+ is defined to be positive (as are the parities of the proton, neutron, and Λ). The quark content is $u\,d\,c$. Results of an analysis of $pK^-\pi^+$ decays (JEZABEK 92) are consistent with $J = 1/2$. ABLIKIM 21N determines the Λ_c^+ spin to be $J = 1/2$, from an angular analysis of various 2-body Λ_c^+ decays in $e^+e^- \to \Lambda_c^+\overline{\Lambda}_c^-$.

We have omitted some results that have been superseded by later experiments. The omitted results may be found in earlier editions.

Λ_c^+ MASS

Our value in 2004, 2284.9 ± 0.6 MeV, was the average of the measurements now filed below as "not used." The BABAR measurement is so much better that we use it alone. Note that it is about 2.6 (old) standard deviations above the 2004 value.

The fit also includes Σ_c–Λ_c^+ and Λ_c^{*+}–Λ_c^+ mass-difference measurements, but this doesn't affect the Λ_c^+ mass. The new (in 2006) Λ_c^+ mass simply pushes all those other masses higher.

[1] AUBERT,B 05S uses low-Q $\Lambda K_S^0 K^+$ and $\Sigma^0 K_S^0 K^+$ decays to minimize systematic errors. The error above includes systematic as well as statistical errors. Many cross checks and adjustments to properties of the BABAR detector, as well as the large number of clean events, make this by far the best measurement of the Λ_c^+ mass.

Λ_c^+ MEAN LIFE

Measurements with an error $\geq 100 \times 10^{-15}$ s or with fewer than 20 events have been omitted from the Listings.

[1] AAIJ 19AG reports [Λ_c^+ MEAN LIFE] / [$D^\pm$ MEAN LIFE] = 0.1956 ± 0.0010 ± 0.0013 which we multiply by our best value $D^\pm$ MEAN LIFE = (1.033 ± 0.005) × 10^{-12} s. Our first error is their experiment's error and our second error is the systematic error from using our best value.

Λ_c^+ DECAY MODES

Branching fractions marked with a footnote, e.g. [a], have been corrected for decay modes not observed in the experiments. For example, the submode fraction $\Lambda_c^+ \to p\overline{K}^*(892)^0$ seen in $\Lambda_c^+ \to pK^-\pi^+$ has been multiplied up to include $\overline{K}^*(892)^0 \to \overline{K}^0\pi^0$ decays.

FIT INFORMATION

An overall fit to 48 branching ratios uses 75 measurements to determine 23 parameters. The overall fit has a $\chi^2 = 52.8$ for 52 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\left\langle\delta x_i \delta x_j\right\rangle/(\delta x_i \cdot \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{\text{total}}$.

[1] This ZUPANC 14 value is the FIRST-EVER model-independent measurement of a Λ_c^+ branching fraction.

[2] See the note by P. Burchat, "Λ_c^+ Branching Fractions," in any edition of the Review from 2002 through 2014 for how this value was obtained. It is now obsolete.

• • • We do not use the following data for averages, fits, limits, etc. • • •					
4.38±0.79±0.21	75	[1] ABLIKIM	23BY	BES3	$e^+ e^-$ at 4.600–4.699 GeV

[1] We do not include this measurement in our average because it is highly correlated to the relative branching fractions B($\Lambda_c \to \Sigma^+ K^+ K^-$) / B($\Lambda_c \to \Sigma^+ \pi^+ \pi^-$) and B($\Lambda_c \to \Sigma^+ \phi$) / B($\Lambda_c \to \Sigma^+ \pi^+ \pi^-$) measured in the same analysis (which we do use). Although the measurements are done on the same data, ABLIKIM 23BY do not obtain exactly B($\Lambda_c \to \Sigma^+ \phi$)·B($\phi \to K^+ K^-$) / B($\Lambda_c \to \Sigma^+ \pi^+ \pi^-$) + B($\Lambda_c^+ \to \Sigma^+ K^+ K^-$ (non-ϕ)) / B($\Lambda_c \to \Sigma^+ \pi^+ \pi^-$) = B($\Lambda_c \to \Sigma^+ K^+ K^-$) / B($\Lambda_c \to \Sigma^+ \pi^+ \pi^-$).

α FOR $\Lambda_c^+ \to \Lambda\pi^+$

VALUE	EVTS	DOCUMENT ID		TECN	COMMENT
-0.755 ± 0.006 OUR AVERAGE					
$-0.755\pm0.005\pm0.003$	264k	[1] LI	23C	BELL	e^+e^- at/near Υ(nS), n=1,...,5
$-0.80\pm0.11\pm0.02$		ABLIKIM	19AX	BES3	e^+e^- at 4.6 GeV
$-0.78\pm0.16\pm0.19$		LINK	06A	FOCS	γ A, $\overline{E}_\gamma \approx$ 180 GeV
$-0.94\pm0.21\pm0.12$	414	[2] BISHAI	95	CLE2	$e^+e^- \approx \Upsilon(4S)$
-0.96 ± 0.42		ALBRECHT	92	ARG	$e^+e^- \approx$ 10.4 GeV
-1.1 ± 0.4	86	AVERY	90B	CLEO	$e^+e^- \approx$ 10.6 GeV

[1] LI 23C obtained the value by a fit for the product $\alpha \times \alpha_\Lambda^{avg}$, and dividing by the value α_Λ^{avg} = 0.7542 ± 0.0026 reported in ABLIKIM 22AG.

[2] BISHAI 95 actually gives $\alpha=-0.94^{+0.21}_{-0.06}{}^{+0.12}_{-0.06}$, chopping the errors at the physical limit -1.0. However, for $\alpha \approx -1.0$, some experiments should *get* unphysical values ($\alpha < -1.0$), and for averaging with other measurements such values (or errors that extend below -1.0) should *not* be chopped.

[1] ABLIKIM 23AT measures α of $\Lambda_c^+ \to \Lambda\mu^+\nu_\mu$ decay over eight q^2 bins from zero to the kinematic endpoint. The value provided here is $\langle\alpha\rangle$, averaged over q^2. The analysis uses form factors extracted from a simultaneous fit to electron and muon mode data.

[2] HINSON 05 measures the form-factor ratio $R \equiv f_2/f_1$ for $\Lambda_c^+ \to \Lambda e^+\nu_e$ events to be $-0.31 \pm 0.05 \pm 0.04$ and the pole mass to be $2.21 \pm 0.08 \pm 0.14$ GeV/c^2, and from these calculates α, averaged over q^2, where $\langle q^2\rangle = 0.67\ (\text{GeV/c})^2$.

[3] ALBRECHT 94B uses Λe^+ and $\Lambda\mu^+$ events in the mass range $1.85 < M(\Lambda\ell^+) < 2.20$ GeV.

[4] CRAWFORD 95 measures the form-factor ratio $R \equiv f_2/f_1$ for $\Lambda_c^+ \to \Lambda e^+\nu_e$ events to be $-0.25 \pm 0.14 \pm 0.08$ and from this calculates α, averaged over q^2, to be the above.

[5] BERGFELD 94 uses Λe^+ events.

α FOR $\Lambda_c^+ \to pK_S^0$
